

FIAB Automatic RF Grommet Welder

FIAB HF is proud to introduce its latest offering to its already comprehensive line of RF welding equipment. This automatic grommet welder has PLC control with digital autotuning, auto hole punch, and automatic feeding of the grommets. The 1.5kw generator, Frequency Stabilized to 27.12 MHz +/-0.6%, ensures a consistent weld while proving itself to be reliable for many years. This machine can not only do single side grommets, but can also do the increasingly popular double grommets. The FIAB Automatic RF Grommet Welder can be either operated by the convenient foot switch or by the control panel. The PLC is controlled by an interactive touch screen. The automatic revolving magazine for the eyelets ensures proper placement and continuous feed for high productivity; it also punches the grommet hole reducing material handling. It is conveniently mounted on wheels for ease of movement. With a convenient 37 inch table height this machine is the perfect compliment to your existing equipment.
